

## THE G-20 AND PROTECTIONISM - A JULY 2015 UPDATE <sup>1</sup>

*The past month has seen the publication of four reports that reveal much about the slowdown of export growth and the trade distortions that have the greatest reach. Since restoring economic growth is a key G-20 mandate factors that hold back global exports should be a priority. The G-20 should rein in the most important trade distortions, many of which don't receive the attention they deserve in official monitoring of protectionism.*

### **Recent reports confirm 2015 export growth slowdown**

Trade data comes out with lag—even so the latest readings are worrying. In late May the OECD confirmed sharp falls in Q1 2015 exports from the G-7 nations and from several large emerging nations (the OECD includes here Brazil, China, India, Indonesia, Russia, and South Africa.) On 24 June 2015 the respected CPB World Trade Monitor confirmed falls in both the volume and the average price of world trade. Falling prices are not confined to volatile commodities markets—average prices of imported manufactures have now fallen back to levels last seen in May 2009.

Worse, when measured in US dollars, total exports of the G-7 countries have not yet to recover to pre-crisis peaks. Among the large emerging markets mentioned above, only China manages to export more than before the crisis. All of this diminishes the contribution that exports are making to the recoveries of G-20 economies. The markdowns in forecasted growth for 2015 and 2016 reported in the IMF's July 2015 World Economic Outlook suggest that G-20 economies cannot afford another pronounced export slowdown.

---

<sup>1</sup> Prepared by Professor Simon J. Evenett and Dr. Johannes Fritz of the University of St. Gallen, Switzerland. Professor Evenett is co-Director of the most established group of international trade researchers in Europe and Coordinator of the Global Trade Alert, an independent watchdog on trade policy.

*All too often fast export growth is used to demote trade policy; with the current global economic slowdown there is no room for complacency.*

### **Official reports on protectionism substantially understates threats to export recovery**

No doubt demand factors--amplified in some cases by supply chains--have had a part to play in the global export slowdown. However, from the beginning of the crisis, the G-20 has rightly been concerned about protectionism and to not repeat the mistakes of the 1930s. To that end, official monitoring of protectionism began.

Coloured perhaps by references to the 1930s, WTO reports on protectionism have focused primarily on trade restrictions. The latest WTO report, published on 12 June 2015, emphasised a slight deceleration in the monthly resort to trade restrictions by G-20 countries. Subsequently, on 7 July 2015, the independent Global Trade Alert (GTA) published its report on crisis-era trade distortions. Covering the same policies and monitoring the same countries as the WTO; the GTA team found:

- 156 trade restrictive measures have been imposed by the G-20 from mid-October 2014 to mid-May 2015, 31% more than the WTO.
- 2080 trade restrictive measures have been imposed by the G-20 since 1 November 2008, 53% more than the WTO.

A direct comparison of the amount of protectionism found by the WTO and the GTA in their latest reports can be found in the Annex to this note. That Annex concludes:

*Official monitoring consistently understates the resort to trade distortions by the G-20. The G-20 work programme on trade should be informed by the most up-to-date and comprehensive statistics on resort to trade distortions.*

### **The biggest distortion to world trade come from artificial export incentives, not import restrictions**

New evidence on the relative importance of different types of trade distortion is now available. Over 6,800 state measures taken by governments worldwide since the first G-20 Leaders Summit have been documented by the independent Global Trade Alert team and, where the data is available, conservative estimates of the share of G-20 exports potentially affected by each trade distortion were computed. Figures 1 and 2 show the main findings.

The WTO's reported estimates of G-20 trade affected by import restrictions are generally very small and this is because they focus principally on recording anti-dumping, anti-subsidy, and safeguard actions. Figure 1 confirms that the share of G-20 exports confronting trade barriers arising from this narrow set of policies has been less than 2% during the crisis era.

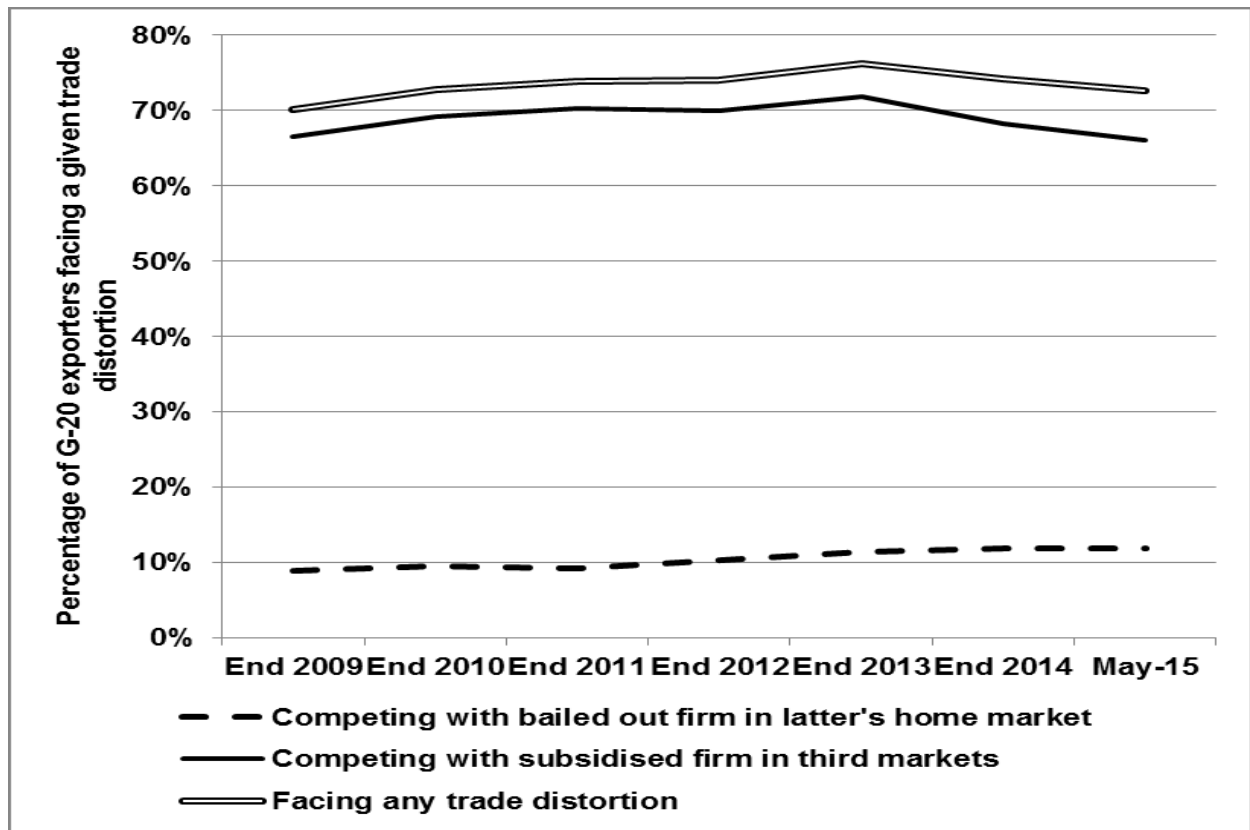

An almost exclusive focus on trade defence is misleading for two reasons. First, other import restrictions have been growing in importance over time. The percentage of G-20 exports facing new tariff increases has risen from 7.5% at the end of 2009 to over 12% by May 2015. A growing percentage of G-20 exports are of products where new "Buy National" provisions have been imposed on state spending. In terms of exports at risk the fastest growth among import restrictions are in new measures that require local content to be purchased—a finding which accords with the growing attention so-called "localisation" measures are receiving in trade policy circles.

**Figure 1: The share of G-20 exports affected by import restrictions—in particular, by non-tariff barriers—is rising.**

Second, for all the attention given to import restrictions it is the spread of incentives to export (normally hidden in arcane provisions in national tax systems) where the action really is. Such has been the spread of export incentives since the crisis began that around 70% of G-20 exports compete against at least one subsidised foreign rivals in third markets (see Figure 2). The scale of the export incentives available in particular in manufacturing may help explain why export prices of these goods aren't growing. Subsidised firms can reduce their prices in a bid to win contracts and other firms must match those price cuts. Finance ministries ought to be worried about the total cost of export-related tax breaks as well.

**Figure 2: The exposure of G-20 exports to import restrictions, however, pales in comparison to the scale of subsidised rivals competing for market share in third markets.**

Overall, as Figure 2 shows, since the crisis began 75% of G-20 exports face at least one new trade distortion. That percentage hasn't fallen. This finding must call into question any confident assertions that governments around the world have refrained from introducing trade distortions since the crisis began or that protectionism shot up in 2009 and has been removed. Moreover, the fact that so many of the contemporary trade distortions are not traditional tariff increases and the like points to the wisdom of last year's request by the G-20 for analysis of non-tariff measures. The broader lesson for policymakers is:

*Not repeating the mistakes of the 1930s means more than not hiking tariffs and imposing import quotas. Focusing on one type of trade distortion encourages some to use others.*

### **Recommendations for the G-20**

To contribute to the revival of global exports, and recognising the role that non-transparent policies play in deterring firms from selling in world markets because they face greater uncertainty, the G-20 should:

- Highlight the global trade slowdown as a major concern and a threat to growth.
- Reaffirm the protectionist pledge.

- Mandate the WTO in its monitoring of trade policies to give as much attention to policies that artificially stimulate exports as it does to import and export restrictions.
- Mandate the WTO to update its earlier reported totals for protectionism to take account of information subsequently received about policies implemented by the G-20.

### **Annex: Comparison of latest WTO and GTA reports on trade measures**

The WTO published its latest Report on G-20 Trade Measures on 12 June 2015. This report covered measures taken by G-20 governments between mid-October 2014 and mid-October 2015.

The Global Trade Alert published its latest report on 7 July 2015. Since the GTA's last report (published in November 2014), 1,066 more government policy initiatives have been documented by the GTA team.

It is possible to compare the findings of the WTO report with statistics extracted from the GTA database for the measures implemented by the G-20 countries, for the reporting period chosen by the WTO secretariat <sup>2</sup>, and for the types of trade measures specifically mentioned in the WTO's report.

The purpose of making this comparison is to inform deliberations on protectionism and related matters at the WTO, at other international organisations, and in national capitals. Some may find the different findings of the WTO and GTA confusing. The goal here is to present the cleanest apples-for-apples comparison based on the parameters chosen by the WTO secretariat <sup>3</sup>.

### **Trade-restrictive measures implemented during latest reporting period**

According to the Executive Summary of the WTO's report on its website <sup>4</sup>: "Since mid-October 2014, G-20 economies applied 119 new trade-restrictive measures over the period — an average of 17 new measures per month."

---

<sup>2</sup> Specifically, for the purpose of the comparison conducted here "Mid October 2014 to Mid May 2015" was taken to be 15 October 2014 to 15 October 2015.

<sup>3</sup> Doing so does not constitute an endorsement of the approach taken by the WTO secretariat, in particular as it relates to the range of policy measures that are relevant to understanding changes in the commercial landscape facing the diverse forms of international commerce in the twenty-first century.

<sup>4</sup> Specifically [https://www.wto.org/english/news\\_e/news15\\_e/trdev\\_15jun15\\_e.htm](https://www.wto.org/english/news_e/news15_e/trdev_15jun15_e.htm)

Over the same time period, considering the same countries (G-20) and the same trade measures considered relevant by the WTO secretariat, the GTA team found that the G-20 had implemented 156 trade-restrictive measures, 31% more than the WTO secretariat.

### **Trade restrictions implemented since October 2008**

Again from the same page on the WTO website: "Overall, this report shows that of the 1,360 restrictions recorded by the monitoring exercise since October 2008, only 329 have been removed."

The GTA database includes government measures implemented since 1 November 2008, a slightly shorter reporting period than the WTO. Nevertheless, the total number of trade restrictions implemented by the G-20 that are documented in the GTA database is 2080, 53% more than that mentioned in the latest WTO report.

With respect to the number of trade restrictions that have been removed, in the GTA database 415 measures implemented by the G-20 are no longer in force. Therefore, 20% of G-20 trade restrictions documented in the GTA database have been removed. The comparable removal percentage implied by the WTO report is 24%.

### **Public procurement measures**

The summary on the WTO website of its report makes direct reference to OECD work on public procurement matters. Specifically: "In the area of government procurement, work from the OECD identifying 65 measures implemented since the financial crisis, suggests that discriminatory government procurement policies have become increasingly popular and potentially affect US\$423 billion of government procurement in the implementing economies."

In the GTA database, 139 G-20 public procurement measures that are discriminate against foreign commercial interests have been documented. During the period mid-October 2014 to mid-May 2015 the GTA team documented 12 more public procurement measures implemented by G-20 members.

### **General Economic Support measures**

Again from the WTO website summary of the latest report: "This report shows that G-20 economies implemented 48 new general economic support measures during the period under review with the majority targeting the manufacturing and agricultural sectors through various incentive schemes, often, but not exclusively, in the context of exports."

Over the same time period, the GTA team documented the following measures implemented by G-20 countries:

- 63 new non-export-related subsidies, state aids, and bailouts
- 12 new export incentives or subsidies
- 8 new trade finance measures

In sum, the GTA has documented 72% more general economic support measures than the WTO secretariat over the same reporting period.

### **TBT and SPS measures**

No comparison is presented here as the GTA does not collect information on these measures.

### **Conclusion**

On every metric relating to trade distortions--where clean comparisons can be made between the recent WTO and GTA reports--the independent GTA team has documented more measures. The difference in performance continues a pattern found with earlier reports and implies that official monitoring consistently understates the extent of G-20 resort to trade distortions.

The G-20 work programme on trade should be informed by the most up-to-date and comprehensive statistics on resort to trade distortions.
